

Technology Transfer definition

The transfer of new technology from the originator to a secondary user, especially from developed to developing countries in an attempt to boost their economies and improve their social status.

Technology transfer is usually the first step in technology commercialization. This also implies that unless a technology is actually used, it has not been successfully transferred and will not ultimately provide public benefits. A “technology” may be an invention, a prototype, finished device, or know-how.

Policy conditions necessary for technology transfer include:

- Sustained research funding to provide pipeline of great ideas
- Ensure that intellectual property rights (IPR) are protected
- Encourage policies that attract investment capital support
- Support public funding through grants and other translational initiatives

Lessons learned about technology transfer
